 Inno3D_HBM_Feedback_Assessment.pdf (302.9 KB)

Dear Sy Phuc,

Thank you again for sharing the detailed feedback and technical discussion points.

We have reviewed the feedback item by item and prepared the attached **Inno3D HBM – Feedback Assessment** document for your review.

In this assessment, we have classified the items into the following categories:

1. UI enhancements and existing feature refinements

These items will be incorporated within the current project plan wherever they align with the ongoing implementation and correction tasks.

2. Bug fixes and rendering corrections

These will also be handled as part of the current plan and prioritized based on impact.

3. New / advanced features

Items such as Oblique MPR, 3D Volume Alignment, Thick Slab, 3D Cropping Box, and Measurement Tools are documented as roadmap / Phase-2 items so that they do not affect the current committed plan.

4. Technical suggestions

We have also included our recommendations for dynamic algorithm parameters using a JSON-based metadata-driven configuration approach, and deep learning model deployment using a DLL/API wrapper-based inference integration.

Please also review the **Open Clarifications** section in the document. A few items require confirmation before finalizing the implementation direction, especially fullscreen behavior, wafer map/result display integration, and certain advanced visualization expectations.

Once we receive your confirmation on the open points, we can align the final priorities and proceed with the next planned updates.

Best regards,

Dijesh K A
